Index Fossils Of North America

Camelops is an extinct genus of camel that lived in western North America from the middle Pliocene to the end of the Pleistocene. It shares a common ancestor with the Old World dromedary and Bactrian camel (making it a true camel), as well as a more distant common ancestor with the New World alpaca, guanaco, llama, and vicuña. Its name is derived from the Ancient Greek κάμελος (cámelos ...

The Coelophysis (scientific name C. Bauri); a short, slender, flesh-eating dinosaur was a bipedal (i.e. it used to walk on two legs) theropod that lived approximately 203-196 million years ago.

Coelophysis dinosaur

It is also in the Silurian that we find the first clear evidence of life on land. While it is possible that plants and animals first moved onto the land in the Ordovician, fossils of terrestrial life from that period are fragmentary and difficult to interpret. Silurian strata have provided likely ascomycete fossils (a group of fungi), as well as remains of the first arachnids and centipedes.

The Silurian Period - UCMP

Though many spectacular plant forms dominated the Carboniferous, most of them disappeared before the end of the Paleozoic. On the left, Neuropteris, a leaf form associated with the cycad-like seed-ferns. On the right, terminal branches from Lepidodendron sternbergii, one of the great scale trees, most of which went extinct in the late Middle Pennsylvanian.

This is a list of dinosaurs whose remains have been recovered from North America. North America has a rich dinosaur fossil record with great diversity of dinosaurs. This may not mean the dinosaurs were more diverse or abundant; it may be because substantial resources have been devoted to the North American fossil record.

Gastornis, formerly known as Diatryma, is an extinct genus of large flightless birds. They lived in the late Paleocene and early Eocene epochs of the Cainozoic. The first remains were discovered in the mid-19th century. In the 1870s, the famous American paleontologist Edward Drinker Cope discovered another, more complete set of fossils in North America, and named them Diatryma.

The theory of plate tectonics (meaning "plate structure") was developed in the 1960's. This theory explains the movement of the Earth's plates (which has since been documented scientifically) and also explains the cause of earthquakes, volcanoes, oceanic trenches, mountain range formation, and many other geologic phenomenon.
