These may include: Ear infections. Diarrhea. Pneumonia. Encephalitis, which can cause deafness and brain damage.

Measles Virus (Rubeola): Symptoms, Causes, Treatment

Measles, also known as morbilli, is an infection of the respiratory system, immune system and skin caused by measles virus (MV), a paramyxovirus of the genus Morbillivirus. Measles is an exceptionally contagious viral infection with a substantial degree of morbidity and significant mortality. 1 Before an effective vaccine became available, measles was an inevitable step in human development.

Measles virus - National Center for Biotechnology Information

Measles virus spreads to many organs via lymphocytes and monocytes by cell-associated viremia. The virus multiplies in lymphoid organs and tissues, such as thymus, spleen, lymph nodes, and tonsils, as well as the skin, lung, gastrointestinal tract, and liver tissues. The hallmark of infection is the multinucleated giant cell.

Measles Virus (Rubeola) - Infectious Disease Advisor

Measles is a highly contagious infectious disease caused by the measles virus. Symptoms usually develop 10–12 days after exposure to an infected person and last 7–10 days. Initial symptoms typically include fever, often greater than 40 °C (104 °F), cough, runny nose, and inflamed eyes. Small white spots known as Koplik's spots may form inside the mouth two or three days after the start ...

Measles - Wikipedia

Measles virus is an enveloped, ribonucleic acid virus of the genus Morbillivirus. Although at least 20 different genotypes have been isolated in various parts of the world, there is only one serotype. Measles is highly contagious, and an infected person will often transmit the virus to over 90% of unprotected close contacts.
