x Nonoperative management protocols of blunt liver and spleen injury in children usually call for serial monitoring of the child's hemoglobin and hematocrit (H/H) at scheduled intervals. We previously demonstrated that the need for emergent intervention is triggered by changes in vital signs, not the findings of scheduled blood draws and changed our protocol accordingly.

x We report the case of a 56 year-old female with a six-year history of severe epigastric pain following chest compressions for cardiac arrest. A comprehensive gastrointestinal workup was negative. However, an abdominal CT scan demonstrated an elongated xiphoid process. After a xiphoid trigger point injection, she experienced pain relief lasting four days, and thus her symptoms were attributed ...

INTRODUCTION. Cardiac arrest results in over 500,000 deaths per year in North America alone [ ]. However, advances in cardiopulmonary resuscitation and post-cardiac arrest care have improved outcomes in select cohorts of patients [ ]. Among these advances are the use of therapeutic hypothermia (TH) and targeted temperature management (TTM), along with other interventions to improve the care of ...

The ACLS and CSU-ALS approaches to resuscitation of postoperative cardiac surgery patients are quite different. The ACLS algorithms tend to focus on people who experience arrest outside the hospital and are resuscitated by bystanders or first responders who initiate CPR, use automated external defibrillators, and administer drugs recommended by ACLS, if available.
